

# APPENDIX

## A1 Machine Learning Algorithms

### A1.1 Lasso

*Lasso* (*least absolute shrinkage and selection operator*) is a type of regularization that performs variable selection. This method aims to enhance predictive power of linear models and to highlight the most valuable predictors. As OLS models tend to exhibit low bias and high variance of forecasts, they may be overfitted. Lasso regularization helps to decrease the risk of overfitting.

In comparison with the Ordinary Least Squares method, there is an added penalty in Lasso:

$$||Xw - y||_2^2 - \lambda ||w||_1 \rightarrow \min \quad (\text{A1.1})$$

where  $\lambda$  is a hyperparameter of Lasso regularization that can be interpreted as the penalty rate.

### A1.2 Gradient Boosting

*Gradient Boosting* was firstly described by [Friedman \(2001\)](#), and its main idea is to create an ensemble of simple models by sequentially fitting and adding parameterized functions. The main goal of this algorithm is to find a function  $F^*(x)$  that maps  $x$  to  $y$  and specific (differentiable) loss function  $\Psi(y, F(x))$  is minimized:

$$F^*(x) =_{F(x)} \Psi(y, F(x)) \quad (\text{A1.2})$$

$F(X)$  is represented as a linear combination of simple models (base learners):

$$F(x) = \sum_{m=0}^M \beta_m h(x; a_m) \implies F_m(x) = F_{m-1}(x) + \beta_m h(x; a_m) \quad (\text{A1.3})$$

where  $h(a; x)$  (base learner) is a simple function of  $x$  with parameters  $a = \{a_1, a_2, \dots\}$ ,  $\beta_m$  is the coefficient behind each base learner  $h_m$  to make a linear combination.

Suppose, we have a training sample  $\{y, x\}$  of size  $N$ . So, function  $F^*(x)$  could be fitted by repeating two steps  $m$  times. Firstly, function  $h(x; a)$  is fitted via least squares

$$a_m =_a \sum_{i=1}^N [y_{im}^* - h(a; x_i)]^2 \quad (\text{A1.4})$$

to the current 'pseudo'-residuals

$$y_{im}^* = - \left[ \frac{\partial \Psi(y_{im}, F(x_{im}))}{\partial F(x_{im})} \right]_{F(x)=F_{m-1}(x)} \quad (\text{A1.5})$$

Then the optimal value of  $\beta_m$  is determined

$$\beta_m =_\beta \sum_{i=0}^N (\Psi(y_i, F_{m-1}(x_i) + \beta h(a_m; x_i))) \quad (\text{A1.6})$$

This method replaces a potentially difficult function optimization problem with one based on least squares followed by a single parameter optimization based on general loss criterion  $\Psi$ .

The most commonly used base learners are binary decision trees (we use them in our study). Further, we use  $L1$  regularization on this algorithm to deal with overfitting. This type of regularization works on Gradient Boosting by constraining the leaf weights, rather than the feature weights.

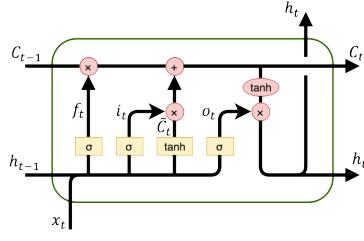

Figure 3: LSTM scheme

### A1.3 Random Forest

*Random forest* was firstly described by Breiman (2001). The algorithm consists of tree-structured algorithms  $\{h(\mathbf{x}, \Theta_k), k = 1, \dots\}$  where  $\{\Theta_k\}$  are i.i.d. random vectors. Each tree casts a unit vote at input  $\mathbf{x}$ . For the regression problem, RF extracts the mean vote of all the trees. The mechanism of tree-structured algorithms is the same as for GB, described above.

### A1.4 LSTM

*Long Short-Term Memory (LSTM)* was first described by Hochreiter and Schmidhuber (1997). LSTM is a kind of recurring neural network tahn can be represented as a sequence of blocks. The principal work of a block is described in Figure 3. This block can also be rewritten as:

$$\begin{aligned}
 f_t &= \sigma(x_t U^f + h_{t-1} W^f + b^f), \\
 i_t &= \sigma(x_t U^i + h_{t-1} W^i + b^i), \\
 o_t &= \sigma(x_t U^o + h_{t-1} W^o + b^o), \\
 \tilde{C}_t &= \tanh(x_t U^g + h_{t-1} W^g + b^g), \\
 C_t &= f_t * C_{t-1} + i_t * \tilde{C}_t, \\
 h_t &= \tanh(C_t) * o_t.
 \end{aligned}$$

where  $W$ ,  $U$  and  $b$  are the parameters of the block,  $x_t$  is an input vector,  $h_t$  is an output vector and  $C_t$  is a vector of conditions. The two functions  $\sigma$  and  $\tanh$  are  $\sigma(x) = \frac{1}{1-e^{-x}}$ , and  $\tanh(x) = \frac{e^x - e^{-x}}{e^x + e^{-x}}$ . LSTM is typically trained with the use of *stochastic gradient descent* or one of its modifications. In our study, we use firstly *ADAM* optimizer, but we switch to alternatives in case it fails.

## A2 Exploratory Data Analysis

### A2.1 Dynamics of log-RV

### A4.3 Prediction-Based Importance of Variables

Table 40: Best variables, chosen by Lasso, SBERBANK

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is Friday, is after weekend
Frequently chosen	log RV S&P, log RV Brent, growth rate of export, growth rate of housing starts, RGBI

Table 41: Best variables, chosen by Lasso, GAZPROM

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is Friday, is after weekend
Frequently chosen	log RV S&P, log RV Brent, growth rate of import, growth rate of CPI, growth rate of housing starts, overnight returns

Table 42: Best variables, chosen by Lasso, LUKOIL

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is Friday, is after weekend
Frequently chosen	log RV S&P, log RV Brent, growth rate of import, growth rate of export, growth rate of housing starts, RGBI

Table 43: Best variables, chosen by Lasso, NOVATEK

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is Friday, is after weekend
Frequently chosen	Log RV S&P, log RV Brent, growth rate of import, growth rate of export, growth rate of CPI, overnight returns, RGBI

Table 44: Best variables, chosen by Lasso, ROSNEFT

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is after weekend
Frequently chosen	Log RV S&P, log RV Brent, growth rate of import, growth rate of CPI, is Friday, overnight returns, RGBI, earning price ratio

Table 45: Best variables, chosen by Lasso, NORNICKEL

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is after weekend
Frequently chosen	Log RV S&P, log RV Brent, growth rate of export, growth rate of CPI, growth rate of GDP, is Friday, overnight returns, RGBI, growth rate of earning price ratio, growth rate of housing starts

Table 46: Best variables, chosen by Lasso, POLYMETAL

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV
Frequently chosen	Log RV S&P, log RV Brent, growth rate of export, growth rate of CPI, is after weekend, is after holiday, is Friday, overnight returns, RGBI, growth rate of earning price ratio, growth rate of housing starts

Table 47: Best variables, chosen by Lasso, POLYUS

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV
Frequently chosen	Log RV S&P, log RV Brent, growth rate of export, is after holiday, is after weekend, is Friday, overnight returns, RGBI, High-Low, growth rate of housing starts

Table 48: Best variables, chosen by Lasso, MAGNIT

	Group of variables
Sustainably chosen	Log RV, log weekly RV, log monthly RV, is after weekend, is Friday
Frequently chosen	Log RV S&P, log RV Brent, growth rate of import, growth rate of GDP, overnight returns, RGBI, growth rate of earning price ratio, growth rate of dividend price ratio, growth rate of housing starts
